Job Market Paper

"**Bayesian dynamic tensor regression**" (with Billio, M., Casarin, R. and S. Kaufmann)

High dimension and multi-array data are becoming increasingly available in economics. They allow a suitable representation as tensor-valued data and this calls for appropriate econometric tools. We propose a new dynamic linear model for tensor-valued response variables and covariates that encompasses some well-known econometric models as special cases. Our contribution is manifold. First, we define a tensor autoregressive process (ART), study its properties and derive the associated impulse response function. Second, we exploit the PARAFAC low-rank decomposition for providing a parsimonious parametrization and to incorporate sparsity effects. We also contribute to inference methods for tensors by developing a Bayesian framework which allows for including extra-sample information and for introducing shrinking effects. We apply the ART model to time-varying multilayer networks of international trade and outstanding credit and study the propagation of shocks across countries, over time and between layers.
